## Phase Margin

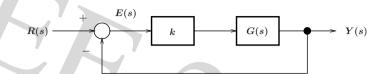

• Consider the system with the following Nyquist plots for different values of k.

There is no k that will make the Nyquist plot cross or touch the point -1 + j0.

 $\Rightarrow GM = \infty.$ 

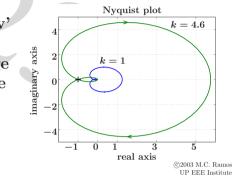

• Will systems such as the one above always be stable? Theoretically? Practically? • Gain margin : what k will make the system unstable?

What k do we need to 'grow' the original Nyquist plot (k = 1) such that it is large enough to touch or cross the point -1 + j0?

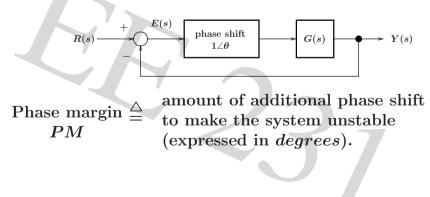

$$\Rightarrow GM = 13.26 \ dB.$$

Nyquist Diagrams EE 231

Phase Margin

• Investigate the effect of time delay and phase shift.

• The phase margin is usually measured at unity open-loop gain. Why?

• Example. Find the phase margin for closed-loop system with the open-loop TF

$$G(s) = \frac{1}{s + 0.5}$$

• Pole of G(s) is at s = -0.5 (LHP). Pole of  $1 + [1 \angle \theta]G(s)$  is also in the LHP.  $\Rightarrow P = 0$ .

For stability, there should be no closed-loop poles in the RHP, i.e., no zeros of  $1 + [1 \angle \theta]G(s)$  in the RHP.  $\Rightarrow Z = 0.$

 $\theta = 45^{\circ}$ 

Phase Margin

• What  $\theta$  will make the system unstable?

 $\rightarrow$  determine what  $\theta$  will make the system unstable.

2

- Thus, from the Principle of the Argument, N = Z - P = 0.Therefore for stability, there should be no encirclements of -1 + j0.
- Looking at the Nyquist plot for  $\theta = 0$ .

There are no encirclements of -1 + j0.

Thus, the system is stable for  $\theta = 0$ .

Nyquist plot

## Phase Margin

• Notice that  $\theta > 0$  rotates the Nyquist plot counterclockwise about the origin.

The phase shift does not affect the size of the plot.

- To find  $\theta$  that will make the system unstable, find angle  $\theta$  such that the Nyquist plot touches -1 + j0.
- Since the Nyquist plot is basically the plot of  $G(j\omega)$  on the complex plane, find  $\theta$  such that the plot of  $[1 \angle \theta]G(j\omega)$  crosses -1 + j0 at some  $\omega$ .

• The point on the Nyquist plot which has unity magnitude will touch the point -1 + j0.

- Phase Margin
- Can we add positive phase?

Not possible in the real world. Physical systems are causal.

⇒ we only need to consider negative phase shift. ⇒ rotate the Nyquist plot clockwise.

• Therefore, the phase margin is

$$heta = -180^o - \phi(+\sqrt{0.75}) = -120^0$$

$$PM = |\theta| = 120^{\circ}$$

• Let us look at the two solutions.

$$\phi(+\sqrt{0.75}) = \angle G(+j\sqrt{0.75}) = -60^{\circ}$$
  

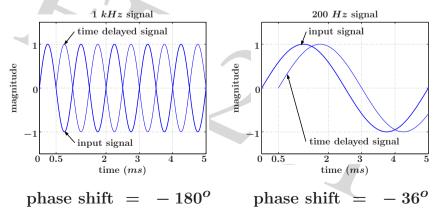

$$\phi(-\sqrt{0.75}) = \angle G(-j\sqrt{0.75}) = +60^{\circ}$$
  
We now just need to figure  
out how much phase to add  
such that the unity  
magnitude point on the  
Nyquist plot swings to the  
point  $-1 + j0$ .  

$$\phi(-\sqrt{0.75}) = +60^{\circ}$$

Nyquist Diagrams EE 231

- The effect of time delay is more apparent in the higher frequency range.
- For some time delay T, the phase shift for a frequency  $\omega$  can be determined based on the ratio of the time delay and the period of the sinusoid.

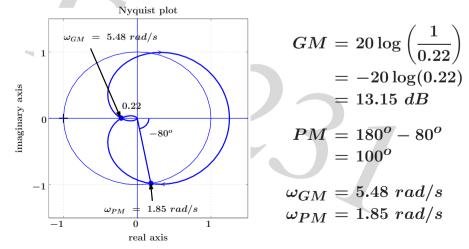

In the frequency domain, the time delay T corresponds to the transfer function

$$G_{TD}(s) \;=\; e^{-sT}$$
  $G_{TD}(j\omega) \;=\; e^{-j\omega T} \;=\; 1 \measuredangle (-\omega T)$

Remarks on Gain and Phase Margins

• The GM and PM can be graphically determined.

- Phase margin from Bode plots?
- Find  $\omega_{PM}$  such that  $|G(j\omega_{PM})| = 0 \ dB.$
- Then, phase margin is  $PM = -180^o - \angle G(j\omega_{PM})$

Nyquist Diagrams EE 231

Remarks on Gain and Phase Margins

• Gain margin and phase margin checks are a subset of the Nyquist stability check.

 $\Rightarrow$  satisfying the gain margin and phase margin requirements may not necessarily lead to a stable system.

 $\Rightarrow$  gain margin and phase margin checks can be used to give an idea on how tolerant the system is to additional gain and additional phase shift.

• Example. Add 12 dB gain and  $-90^{\circ}$  phase shift to the previous system. Is it still stable?

UP EEE Institute

• How do you determine the gain and phase margins from Bode plots?

• Relevant Octave commands.

>> nyquist(tf(50, [1 9 30 40])) >> [Gm, Pm, Wcg, Wcp] = margin(tf(50, [1 9 30 40]))

Gm = 4.6000 Pm = 100.6620 Wcg = 5.4772 Wcp = 1.8484
