- Review what is gain margin.
- Look at phase margin.
- Remarks about gain margin and phase margin.

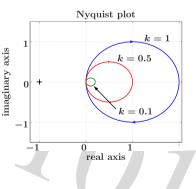

• Put it all together.

Nyquist Diagrams EEE 101 ©2003 M.C. Ramos UP EEE Department

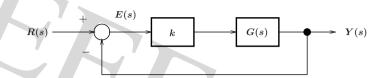

Phase Margin

• Consider the system with the following Nyquist plots for different values of k.

There is no k that will make the Nyquist plot cross or touch the point -1 + j0. $\Rightarrow GM = \infty$.

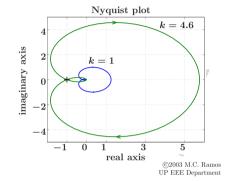

• Will systems such as the one above always be stable? Theoretically? Practically? • Gain margin : what k will make the system unstable?

What k do we need to 'grow' the original Nyquist plot (k = 1) such that it is large enough to touch or cross the point -1 + j0?

 $\Rightarrow GM = 13.26 \ dB.$

Phase Margin

• Investigate the effect of time delay and phase shift.

• The phase margin is usually measured at unity open-loop gain. Why?

• Example. Find the phase margin for closed-loop system with the open-loop TF

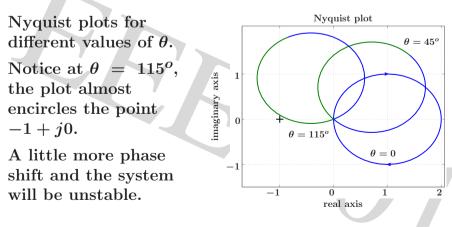

$$G(s) = \frac{1}{s + 0.5}$$

• Pole of G(s) is at s = -0.5 (LHP). Pole of $1 + [1 \angle \theta]G(s)$ is also in the LHP. $\Rightarrow P = 0$.

For stability, there should be no closed-loop poles in the RHP, i.e., no zeros of $1 + [1 \angle \theta]G(s)$ in the RHP. $\Rightarrow Z = 0.$

- Phase Margin
- What θ will make the system unstable?

 \rightarrow determine what θ will make the system unstable.

- Thus, from the Principle of the Argument, N = Z - P = 0.Therefore for stability, there should be no encirclements of -1 + j0.
- Looking at the Nyquist plot for $\theta = 0$.

There are no encirclements of -1 + j0.

Thus, the system is stable for $\theta = 0$.

Phase Margin

• Notice that $\theta > 0$ rotates the Nyquist plot counterclockwise about the origin.

The phase shift does not affect the size of the plot.

- To find θ that will make the system unstable, find angle θ such that the Nyquist plot touches -1 + j0.
- Since the Nyquist plot is basically the plot of $G(j\omega)$ on the complex plane, find θ such that the plot of $[1 \angle \theta]G(j\omega)$ crosses -1 + j0 at some ω .

• The point on the Nyquist plot which has unity magnitude will touch the point -1 + j0.

Phase Margin

• Can we add positive phase?

Not possible in the real world. Physical systems are causal.

 \Rightarrow we only need to consider negative phase shift. \Rightarrow rotate the Nyquist plot clockwise.

• Therefore, the phase margin is

$$\theta = -180^{o} - \phi(+\sqrt{0.75}) = -120$$

 $PM = |\theta| = 120^o$

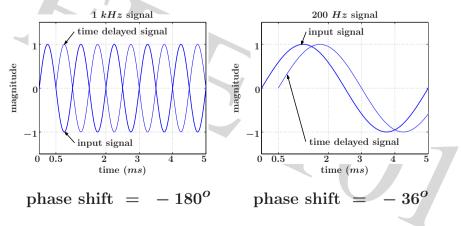

$$\phi(+\sqrt{0.75}) = \angle G(+j\sqrt{0.75}) = -60^{\circ}$$

$$\phi(-\sqrt{0.75}) = \angle G(-j\sqrt{0.75}) = +60^{\circ}$$

We now just need to figure
out how much phase to add
such that the unity
magnitude point on the
Nyquist plot swings to the
point $-1 + j0$.
The form the form the form the point on the point $-1 + j0$.
The form the form the point on the point on the point $-1 + j0$.
The form the point on the point on the point $-1 + j0$.
The form the point on the point on the point $-1 + j0$.
The form the point point $-1 + j0$.
The form the point point $-1 + j0$.
The form the point poin

Nyquist EEE 10

- The effect of time delay is more apparent in the higher frequency range.
- For some time delay T, the phase shift for a frequency ω can be determined based on the ratio of the time delay and the period of the sinusoid.

In the frequency domain, the time delay T corresponds to the transfer function

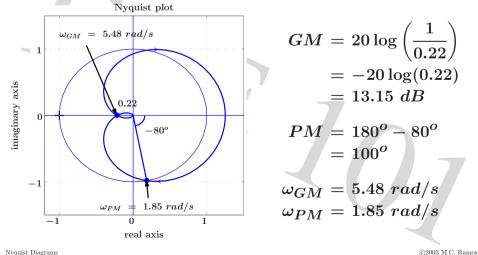

$$egin{array}{rl} G_{TD}(s) &=& e^{-sT} \ G_{TD}(j\omega) &=& e^{-j\omega T} &=& 1 ar{a}(-\omega T) \end{array}$$

Remarks on Gain and Phase Margins

• The GM and PM can be graphically determined.

- Phase margin from Bode plots?
- Find ω_{PM} such that $|G(j\omega_{PM})| = 0 \ dB.$
- Then, phase margin is $PM = -180^{o} - \angle G(j\omega_{PM})$

Nyquist Diagrams EEE 101

Remarks on Gain and Phase Margins

• Gain margin and phase margin checks are a subset of the Nyquist stability check.

 \Rightarrow satisfying the gain margin and phase margin requirements may not necessarily lead to a stable system.

 \Rightarrow gain margin and phase margin checks can be used to give an idea on how tolerant the system is to additional gain and additional phase shift.

• Example. Add 12 dB gain and -90° phase shift to the previous system. Is it still stable?

Nyquist Diagrams EEE 101 • How do you determine the gain and phase margins from Bode plots?

• Relevant Matlab commands.

```
>> nyquist(50, [1 9 30 40])
>> [Gm, Pm, Wcg, Wcp] = margin(50, [1 9 30 40])
```

Gm = 4.6000 Pm = 100.6620 Wcg = 5.4772 Wcp = 1.8484
